

MEASURES OF NON-STRICT-SINGULARITY AND NON-STRICT-COSINGULARITY

Snežana Živković

Abstract. In this paper we investigate a new measure of non-strict-singularity and a new measure of non-strict-cosingularity. Measures of non-strict-singularity and of non-strict-cosingularity have been investigated in [11], [8], [12], [7], [9], [15].

1. Introduction and preliminaries

In this paper X , Y and Z are complex Banach spaces, $B(X, Y)$ ($K(X, Y)$) the set of all bounded (compact) linear operators from X into Y . We shall write $B(X)$ ($K(X)$) instead of $B(X, X)$ ($K(X, X)$).

An operator $T \in B(X, Y)$ is in $\Phi_+(X, Y)$ ($\Phi_-(X, Y)$) if the range $R(T)$ is closed in Y and the dimension $\alpha(T)$ of the null space $N(T)$ of T is finite (the codimension $\beta(T)$ of $R(T)$ in Y is finite). Operators in $\Phi_+(X, Y) \cup \Phi_-(X, Y)$ are called semi-Fredholm operators. We set $\Phi(X, Y) = \Phi_+(X, Y) \cap \Phi_-(X, Y)$. The operators in $\Phi(X, Y)$ are called Fredholm operators. We shall write $\Phi_+(X)$ (resp. $\Phi_-(X)$, $\Phi(X)$) instead of $\Phi_+(X, X)$ (resp. $\Phi_-(X, X)$, $\Phi(X)$).

Let B_X denote the closed unit ball of X . Let $T \in B(X, Y)$ and

$$m(T) = \inf\{\|Tx\| : \|x\| = 1\}$$

be the *minimum modulus* of T , and let

$$q(T) = \sup\{\varepsilon \geq 0 : \varepsilon B_Y \subset TB_X\}$$

be the *surjection modulus* of T .

If M is a subspace of X , then J_M will denote the embedding map of M into X , and if V is a subspace of Y , then Q_V will denote the canonical map of Y onto the quotient space Y/V .

An operator $T \in B(X, Y)$ is *strictly singular* ($T \in S(X, Y)$) if, for every infinite dimensional (closed) subspace M of X , the restriction of T to M , $T|_M$, is not a

AMS Subject Classification: 47 A 10, 47 A 53

Keywords and phrases: Strictly (co)singular operators, measures of non-strict-(co)singularity, semi-Fredholm operators.

homeomorphism, i.e., $m(T|_M) = 0$. An operator $T \in B(X, Y)$ is *strictly cosingular* ($T \in SC(X, Y)$) if, for every infinite codimensional closed subspace V of Y the composition $Q_V T$ is not surjective. It is well known that

$$K(X, Y) \subset S(X, Y) \quad \text{and} \quad K(X, Y) \subset SC(X, Y). \quad (1.1)$$

If Ω is a non-empty bounded subset of X , then the Hausdorff measure of noncompactness of Ω is denoted by $\chi(\Omega)$, and defined as follows

$$\chi(\Omega) = \inf\{\varepsilon > 0 : \Omega \text{ has a finite } \varepsilon\text{-net in } X\}.$$

For $A \in B(X, Y)$ the Hausdorff measure of noncompactness of A , denoted by $\|A\|_X$, is defined by

$$\|A\|_X = \inf\{k \geq 0 : \chi_Y(A\Omega) \leq k\chi_X(\Omega), \Omega \subset X \text{ is bounded}\}.$$

Recall that ([2])

$$\|A\|_X = \inf\{\|Q_V A\| : V \text{ is a subspace of } Y, \dim V < \infty\}.$$

For $A \in B(X, Y)$, set (see [6])

$$\|A\|_\mu = \inf\{\|AJ_L\| : L \text{ closed subspace of } X, \text{codim } L < \infty\}.$$

Recall that

$$\|A\|_X = 0 \iff \|A\|_\mu = 0 \iff A \in K(X, Y). \quad (1.2)$$

For $A \in B(X, Y)$, set

$$\begin{aligned} G_M(A) &= \inf_{N \subset M} \|AJ_N\|, & G(A) &= G_X(A), \\ \Delta_M(A) &= \sup_{N \subset M} G_N(A), & \Delta(A) &= \Delta_X(A), \end{aligned}$$

where M, N denote closed infinite dimensional subspaces of X (see [11]). Δ is a measure of non-strict-singularity of operators, i.e.,

$$\Delta(A) = 0 \iff A \in S(X, Y). \quad (1.3)$$

Weis [8] introduced for $A \in B(X, Y)$ the following functions

$$\begin{aligned} K_V(A) &= \inf_{W \supset V} \|Q_W A\|, & K(A) &= K_{\{0\}}(A), \\ \nabla_V(A) &= \sup_{W \supset V} K_W(A), & \nabla(A) &= \nabla_{\{0\}}(A), \end{aligned}$$

where V, W denote closed infinite codimensional subspaces of Y .

∇ is a measure of non-strict-cosingularity, i.e.,

$$\nabla(A) = 0 \iff A \in SC(X, Y). \quad (1.4)$$

Recall that

$$\nabla(A + T) = \nabla(A) \quad \text{for all } T \in SC(X, Y), \quad (1.5)$$

and

$$K_V(A) = \inf_{W \supset V} \|Q_W A\|_X, \quad (1.6)$$

where V, W denote closed infinite codimensional subspaces of Y (see [12, Summary and discussion, Remark 2] or [7, Example 5.3] or [15, Lemma 2.21]).

Recall that ([11], [13])

$$\begin{aligned} G(A) > 0 &\iff A \in \Phi_+(X, Y), \\ K(A) > 0 &\iff A \in \Phi_-(X, Y). \end{aligned} \quad (1.7)$$

2. Results

Schechter [11] proved the next theorem.

THEOREM 2.1. *$A \in \Phi_+(X, Y)$ if and only if for each Banach space Z there is a constant c , $0 < c < \infty$, such that*

$$\Delta(T) \leq c\Delta(AT), \quad T \in B(Z, X).$$

We can prove the dual theorem.

THEOREM 2.2. *$A \in \Phi_-(X, Y)$ if and only if for each Banach space Z there is a constant c , $0 < c < \infty$, such that*

$$\nabla(T) \leq c\nabla(TA), \quad T \in B(Y, Z). \quad (2.2.1)$$

Proof. Let $A \in \Phi_-(X, Y)$. By [6, Theorem 5.5 and Theorem 3.1] it follows that there is a constant c , $0 < c < \infty$, such that for each Banach space Z

$$\|T\|_X \leq c\|TA\|_X, \quad T \in B(Y, Z). \quad (2.2.2)$$

Let V be a closed subspace of Z with $\text{codim } V = \infty$ and $\varepsilon > 0$. From (1.6) it follows that there is a closed subspace W of Z such that $W \supset V$, $\text{codim } W = \infty$ and

$$\|Q_W TA\|_X < K_V(TA) + \varepsilon. \quad (2.2.3)$$

From (1.6), (2.2.2) and (2.2.3) it follows that

$$\begin{aligned} K_V(T) &\leq \|Q_W T\|_X \leq c\|Q_W TA\|_X \leq c(K_V(TA) + \varepsilon) \\ &\leq c(\nabla(TA) + \varepsilon). \end{aligned}$$

Hence $\nabla(T) \leq c(\nabla(TA) + \varepsilon)$.

Assume $A \notin \Phi_-(X, Y)$. By [1, Theorem 4.4.10] it follows that there is an operator $C \in K(X, Y)$ such that $\text{codim } \overline{R(A-C)} = \infty$. Let $V = \overline{R(A-C)}$. Since $Q_V(A-C) = 0$, from (1.1) and (1.5) we get $\nabla(Q_V A) = \nabla(Q_V(A-C)) = 0$. Let M

and N be closed subspaces of Y/V with $\text{codim } M = \infty$, $N \supset M$ and $\text{codim } N = \infty$. Since $\|Q_N Q_V\| = 1$ we get

$$\nabla(Q_V) = \sup_{\substack{M \subset Y/V \\ \text{codim } M = \infty}} \inf_{\substack{N \supset M \\ \text{codim } N = \infty}} \|Q_N Q_V\| = 1.$$

Thus, there is no constant c , $0 < c < \infty$, such that (2.2.1) holds. ■

Let S be a subset of a Banach space A . The perturbation class associated with S is denoted by $P(S)$ and

$$P(S) = \{a \in A : a + s \in S \text{ for all } s \in S\}.$$

The perturbation class associated with $\Phi_+(X, Y)$ ($\Phi_-(X, Y)$) is denoted by $P(\Phi_+(X, Y))$ ($P(\Phi_-(X, Y))$).

For $T \in B(X, Y)$, set (see [10], [14])

$$\begin{aligned} n_{P\Phi_+} &= \|T\|_{P\Phi_+} = \inf\{\|T - P\| : P \in P(\Phi_+(X, Y))\}, \\ n_{P\Phi_-} &= \|T\|_{P\Phi_-} = \inf\{\|T - P\| : P \in P(\Phi_-(X, Y))\}, \end{aligned}$$

The next theorem is inspired by [3, Example 1].

THEOREM 2.3. *Let $T \in B(X, Y)$. Then*

$$m(T) \leq \|T\|_{P\Phi_+} \leq \|T\|, \quad (2.3.1)$$

$$q(T) \leq \|T\|_{P\Phi_-} \leq \|T\|. \quad (2.3.2)$$

Proof. (2.3.1) Assume $P \in P(\Phi_+(X, Y))$. It implies $P \notin \Phi_+(X, Y)$. By [1, Theorem 4.4.7] it follows that there is $K \in K(X, Y)$ such that $\dim N(P - K) = \infty$. Set $M = N(P - K)$ and $\varepsilon > 0$. By (1.2) we get $\|PJ_M\|_\mu = \|KJ_M\|_\mu = 0$. Hence there is a closed subspace $V \subset M$ such that $\dim M/V < \infty$ and $\|PJ_V\| < \varepsilon$. For $x \in V$ we have

$$\|Tx - Px\| \geq \|Tx\| - \|Px\| \geq m(T)\|x\| - \varepsilon\|x\|.$$

It implies $\|T - P\| \geq \|(T - P)J_V\| \geq m(T) - \varepsilon$. Hence $\|T - P\| \geq m(T)$. Thus $\|T\|_{P\Phi_+} \geq m(T)$.

(2.3.2) Let $P \in P(\Phi_-(X, Y))$. Then $P \notin \Phi_-(X, Y)$. From [1, Theorem 4.4.10] it follows that there is $K \in K(X, Y)$ such that $\text{codim } \overline{R(P - K)} = \infty$. Set $U = \overline{R(P - K)}$. From $Q_U(P - K) = 0$ and (1.2) it follows $\|Q_U P\|_\chi = \|Q_U K\|_\chi = 0$. Hence for $\varepsilon > 0$ there is a finite dimensional subspace $W \subset Y/U$ such that $\|Q_W Q_U P\| < \varepsilon$. There is a closed subspace $V \subset Y$ such that $V \supset U$ and $W = V/U$. It is not difficult to see that the operator $A: (Y/U)/(V/U) \rightarrow Y/V$ defined by

$$A((y + U) + V/U) = y + V, \quad y \in Y,$$

is an isometric isomorphism and $AQ_{V/U}Q_U = Q_V$. Hence $\|Q_V P\| = \|Q_{V/U}Q_U P\|$. It follows that $\|Q_V P\| < \varepsilon$. Hence

$$\|T - P\| \geq \|Q_V(T - P)\| \geq \|Q_V T\| - \|Q_V P\| \geq q(Q_V T) - \varepsilon \geq q(T) - \varepsilon.$$

Thus $\|T - P\| \geq q(T)$, and $\|T\|_{P\Phi_-} \geq q(T)$. ■

Now we use the notation of [7]: let, for $T \in B(X, Y)$,

$$\begin{aligned} \text{sn}_{P\Phi_+}(T) &= \sup_M n_{P\Phi_+}(TJ_M), \\ \text{isn}_{P\Phi_+}(T) &= \inf_M \text{sn}_{P\Phi_+}(TJ_M), \end{aligned}$$

where M denotes a closed infinite dimensional subspace of X and

$$\begin{aligned} \text{sn}'_{P\Phi_-}(T) &= \sup_U n_{P\Phi_-}(QU T), \\ \text{isn}'_{P\Phi_-}(T) &= \inf_U \text{sn}'_{P\Phi_-}(QU T), \end{aligned}$$

where U denotes a closed infinite codimensional subspace of Y .

Zemánek [13] considered the following functions

$$\begin{aligned} u(A) &= \sup\{m(AJ_W) : W \text{ is a closed subspace of } X \text{ with } \dim W = \infty\}, \\ v(A) &= \sup\{q(Q_V A) : V \text{ is a closed subspace of } Y \text{ with } \text{codim } V = \infty\}. \end{aligned}$$

From the definition of the strictly singular and strictly cosingular operators it is obvious that

$$\begin{aligned} u(A) = 0 &\iff A \in S(X, Y), \\ v(A) = 0 &\iff A \in SC(X, Y). \end{aligned} \tag{2.4}$$

For $A \in B(X, Y)$ set (see [4], [5])

$$\begin{aligned} G_u(A) &= \inf\{u(AJ_M) : M \text{ is a closed subspace of } X, \dim M = \infty\}, \\ K_v(A) &= \inf\{v(Q_U A) : U \text{ is a closed subspace of } Y, \text{codim } U = \infty\}. \end{aligned}$$

Recall that

$$\begin{aligned} G_u(A) > 0 &\iff A \in \Phi_+(X, Y), \\ K_v(A) > 0 &\iff A \in \Phi_-(X, Y). \end{aligned} \tag{2.5}$$

From (2.3.1) and (2.3.2) it follows

$$\begin{aligned} G_u(T) &\leq \text{isn}_{P\Phi_+}(T) \leq G(T), \\ K_v(T) &\leq \text{isn}'_{P\Phi_-}(T) \leq K(T). \end{aligned} \tag{2.6}$$

By (2.6), (1.7) and (2.5) we get

$$\begin{aligned} \text{isn}_{P\Phi_+}(T) > 0 &\iff T \in \Phi_+(X, Y), \\ \text{isn}'_{P\Phi_-}(T) > 0 &\iff T \in \Phi_-(X, Y). \end{aligned} \tag{2.7}$$

(2.7) follows also from [7, Theorem 2.3(2) and Theorem 3.3(2)].

For $T \in B(X, Y)$, set

$$\begin{aligned} \Delta_{P\Phi_+}(T) &= \sup_M \inf_{N \subset M} \|TJ_N\|_{P\Phi_+}, \\ \nabla_{P\Phi_-}(T) &= \sup_V \inf_{W \supset V} \|Q_W T\|_{P\Phi_-}, \end{aligned}$$

where M, N denote closed infinite dimensional subspaces of X and V, W denote closed infinite codimensional subspaces of Y .

Analogously as in [11] it can be proved that $\Delta_{P\Phi_+}$ ($\nabla_{P\Phi_-}$) is a seminorm.

From (2.3.1) and (2.3.2) it follows

$$\begin{aligned} u &\leq \Delta_{P\Phi_+} \leq \Delta, \\ v &\leq \nabla_{P\Phi_-} \leq \nabla. \end{aligned} \quad (2.8)$$

By (2.8), (1.3), (1.4) and (2.4) we get that $\Delta_{P\Phi_+}$ is a measure of non-strict-singularity and $\nabla_{P\Phi_-}$ is a measure of non-strict-cosingularity, i.e.,

$$\Delta_{P\Phi_+}(T) = 0 \iff T \in S(X, Y), \quad (2.9)$$

$$\nabla_{P\Phi_-}(T) = 0 \iff T \in SC(X, Y). \quad (2.10)$$

(2.9) and (2.10) follow also from [7, Theorem 2.4(2) and Theorem 3.3(2)].

It is well known that

$$S(X, Y) \subset P(\Phi_+(X, Y)) \quad \text{and} \quad SC(X, Y) \subset P(\Phi_-(X, Y)).$$

THEOREM 2.4. *Let X and Y be Banach spaces. Then:*

(2.11.1) $S(X, Y) = P(\Phi_+(X, Y))$ if and only if from $P \in P(\Phi_+(X, Y))$ it follows $PJ_M \in P(\Phi_+(M, Y))$ for each closed infinite dimensional subspace M of X ;

(2.11.2) $SC(X, Y) = P(\Phi_-(X, Y))$ if and only if from $P \in P(\Phi_-(X, Y))$ it follows $Q_V P \in P(\Phi_-(X, Y/V))$ for each closed infinite codimensional subspace V of Y .

Proof. (2.11.1). Let $S(X, Y) = P(\Phi_+(X, Y))$. Suppose M is a closed infinite dimensional subspace of X and $P \in P(\Phi_+(X, Y))$. Then $P \in S(X, Y)$. It implies $PJ_M \in S(M, Y) \subset P(\Phi_+(M, Y))$.

Assume that for each closed infinite dimensional subspace M of X from $P \in P(\Phi_+(X, Y))$ it follows $PJ_M \in P(\Phi_+(M, Y))$. Hence for $T \in B(X, Y)$ we get

$$\begin{aligned} \|TJ_M\|_{P\Phi_+} &= \inf\{\|TJ_M - P_1\| : P_1 \in P(\Phi_+(M, Y))\} \\ &\leq \inf\{\|TJ_M - PJ_M\| : P \in P(\Phi_+(X, Y))\} \\ &\leq \inf\{\|T - P\| : P \in P(\Phi_+(X, Y))\} \leq \|T\|_{P\Phi_+}. \end{aligned}$$

Therefore

$$\Delta_{P\Phi_+}(T) \leq \|T\|_{P\Phi_+}. \quad (2.11.3)$$

If $T \in P(\Phi_+(X, Y))$, then $\|T\|_{P\Phi_+} = 0$. By (2.11.3) it follows that $\Delta_{P\Phi_+}(T) = 0$. From (2.9) we get $T \in S(X, Y)$. Thus $S(X, Y) = P(\Phi_+(X, Y))$.

(2.11.2). Analogously to (2.11.1). ■
